

Ordering Information

Package	Top Mark	Part No.
16-Pin DFN5×6-16L, Pb-free	WS7010AD XXYMXX	WS7010AD

Pin Configuration

Pin Description

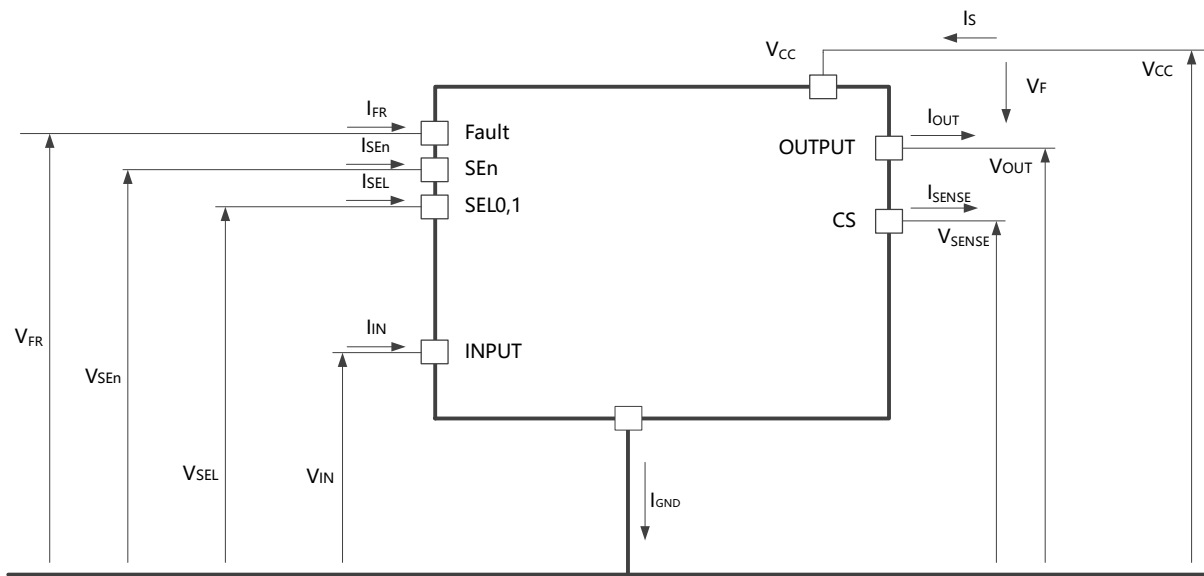

Pin Name	Pin NO.	Pin Description
INPUT	1	Voltage controlled input pin with hysteresis, compatible with 3 V and 5 V CMOS outputs. It controls output switch state.
Fault	2	Active low compatible with 3 V and 5 V CMOS outputs pin, it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.
SEn	3	Active high compatible with 3 V and 5 V CMOS outputs pin, it enables the CS diagnostic pin.
GND	4	Ground connection. Must be reverse battery protected by an external diode / resistor network.
SEL0	5	Active high compatible with 3 V and 5 V CMOS outputs pin; they address the CS multiplexer.
SEL1	6	
CS	7	Multiplexed analog sense output pin; it delivers a current proportional to the selected diagnostic: load current, supply voltage or chip temperature.
OUTPUT	9/10/11/12/13/14/15/16	Power outputs.
NC	8	No connect.
V _{cc}	EPAD	Battery connection.

Table 1. Suggested connections for unused and not connected pins

Connection / pin	CS	NC	OUTPUT	INPUT	SEn, SEL0/1, Fault
Floating	Not allowed	X ⁽¹⁾	X	X	X
To ground	Through 1K resistor	X	Not allowed	Through 15K resistor	Through 15K resistor

Note1: X do not care.

Current and Voltage Conventions

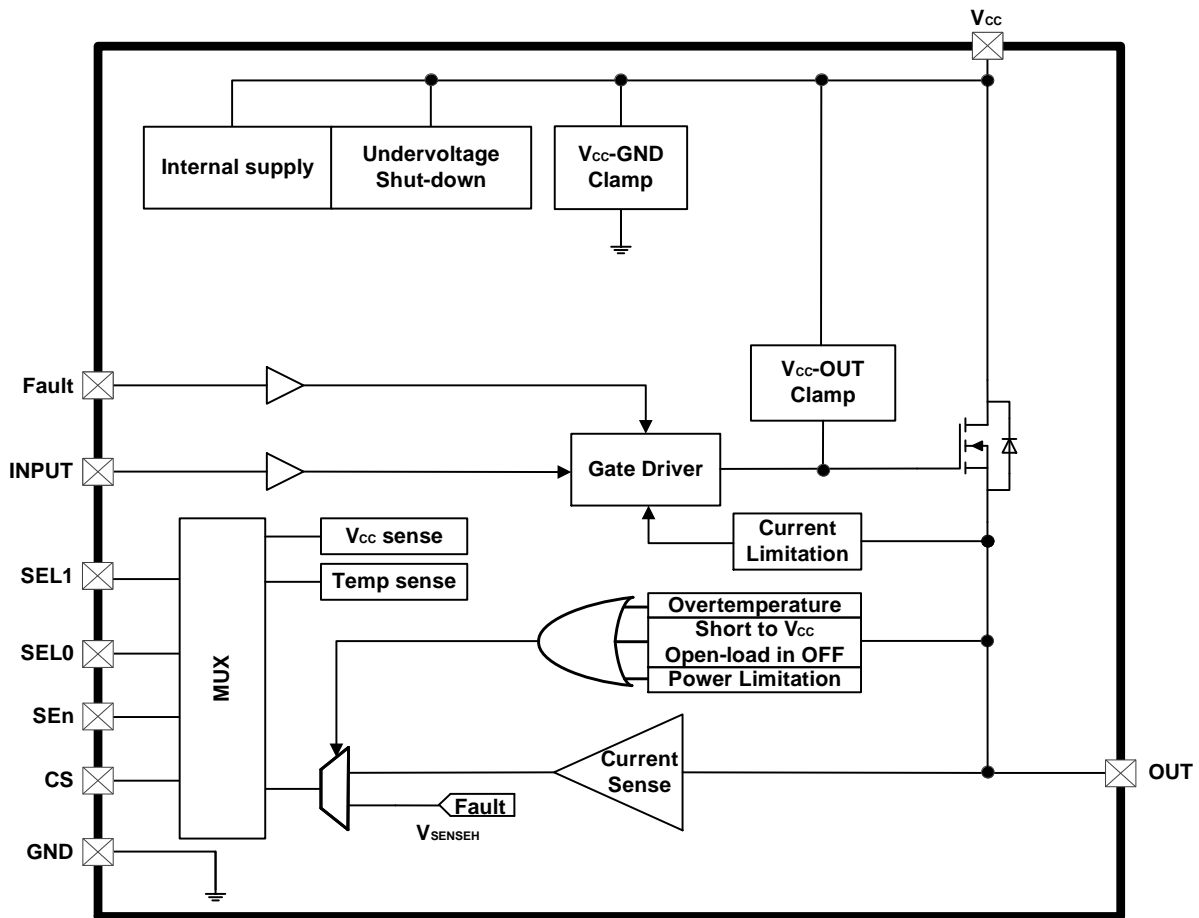

Note2: $V_F = V_{OUT} - V_{CC}$ during reverse battery condition.

Absolute Maximum Ratings (Note3)

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	38	V
$-V_{CC}$	Reverse DC supply voltage	0.3	V
$-I_{GND}$	DC reverse ground pin current	50	mA
I_{OUT}	OUTPUT DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	2.0	
$V_{IN}, V_{SEn}, V_{SEL}, V_{Fault}$	INPUT, SE _n , SEL _{0,1} , Fault DC input voltage	-0.3 to 6.6	V
I_{SENSE}	CS pin DC output current	20	mA
	CS pin DC output current in reverse	-20	
E_{MAX}	Maximum switching energy (single pulse)($T_{DEMAG}=0.4\text{ ms}, T_{jstart}=150^{\circ}\text{C}$)	20	mJ
V_{ESD}	JEDEC standard (Electrostatic discharge)	JEDEC 22A-114F	
	INPUT, CS, SE _n , SEL _{0,1} , Fault	2000	V
	V_{CC} , OUTPUT	3000	
V_{ESD}	Charge device model (CDM-AEC-Q100-011)	1000	V
T_j	Junction operating temperature	-40 to 150	°C
T_{stg}	Storage temperature	-55 to 150	

Note3: Stressing the device above the rating listed in Absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Functional Block

Electrical Characteristics (Note4)

Power section

Parameter	Symbol	Test Condition	Min.	Typ.	Max.	Unit
Operating supply voltage	V_{CC}		4.5	13	28	V
Under voltage shutdown	V_{USD}				4.5	V
Under voltage shutdown reset	$V_{USDReset}$				5	V

Functional Description

Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_j through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_j exceeds the safety level of ΔT_{j_SD} . According to the voltage level on the Fault pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled (Fault = Low) or remains off (Fault = High). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the Fault pin, the device switches on again as soon as its junction temperature drops to T_R (Fault = Low) or remains off (Fault = High).

Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

Negative voltage clamp

In case the device drives inductive load, the output voltage reaches a negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMAG} , allowing the inductor energy to be dissipated without damaging the device.

Diode (D_{GND}) in the ground line

A resistor (typ. $R_{GND}=4.7K$) should be inserted in parallel to D_{GND} if the device drives an inductive load. This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ($\approx 600mV$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. WS suggests to insert a resistor ($R_{prot}=15K$) in line both to prevent the micro-controller I/O pins from latching-up and to protect the HSD inputs. The value of these resistors is a compromise between the leakage current of micro-controller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of micro-controller I/Os.

CS - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (CS) delivering the following signals:

- Current monitor: current mirror of channel output current
- V_{CC} monitor: voltage proportional to V_{CC}
- T_{CASE} : voltage proportional to chip temperature

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in CS multiplexer addressing Table.

Current monitor

When current mode is selected in the CS, this output is capable to provide:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to known ratio named K
- Diagnostics flag in fault conditions delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} can be easily converted to a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

While device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations.

Current provided by CS output: $I_{SENSE} = I_{OUT}/K$

Voltage on R_{SENSE} : $V_{SENSE} = R_{SENSE} * I_{SENSE} = R_{SENSE} * I_{OUT}/K$

Where:

- V_{SENSE} is voltage measurable on R_{SENSE} resistor
- I_{SENSE} is current provided from CS pin in current output mode
